Petition for Declaratory Statement
Before the Florida Building Commission

The Petitioner, Raymond A. Manucy, on behalf of RM Enterprises, pursuant to Section 120.565 and 553.77.(I) (c), Florida Statutes, and the Uniform Rules of Declaratory Statements Chapter 28-105, Florida Administrative Code, hereby submits a request for a declaratory statement from the Florida Building Commission. As grounds for this request the petitioner submit's the following.

Petitioner's Name and Address

NAME: Raymond A. Manucy
President, RM Enterprises Inc.

ADDRESS: 352 A Tall Pines Road
West Palm Beach, FL 33413

TEL: 561-682-1225
FAX: 561-682-5611

Statutory Provision on which the Declaratory Statement is sought

As a manufacture (R M ENTERPRISES INC.) of hurricane roof stands, tie down clips and wall brackets for mounting air conditioning units. Currently I have a 2007 Florida Product Approval (FL 3203-R2) with the state of Florida. **I have gone to great expense and time so that I can meet the new Florida Building Code 2010, ASCE 7-10 (FL). I am in the process with a validator to have my stands, and tie down clips processed to be approved for the new Florida building Code 2010, ASCE 7-10(FL), with the state of Florida.** According to HB 704 I don't have to comply to the Florida Building Code 2010, ASCE 7-10(FL). The petitioner is requesting clarification as to HB 704 - Relating to the Florida Building Commission and the Florida Building Code, Chapter Law Number No. 2012-13, Approved by the Governor 3/23/2012, Section 16-4). Notwithstanding the provisions of this section, approved mechanical equipment or appliances fastened to a roof or installed on the ground in compliance with the code using rated stands, platforms, curbs, slabs, or other means are deemed to comply with the wind resistance requirements of the 2007 Florida Building Code, as amended. Further support of enclosure of such mechanical equipment or appliances is not required by a state or local official having authority to enforce the Florida Building Code. This subsection expires on the effective date of the 2013 2014 Florida Building Code.

Background:

Florida Building Code 2010, ASCE 7. Section 301.12 Wind Resistance of the Mechanical section of the Florida Code. 301.12 Wind Resistance. Mechanical equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures on the equipment and the supports as determined in accordance with the Florida Building Code, Building. Roof-mounted mechanical units and supports shall be secured to the structure. The use of wood “sleepers” shall not be permitted

Questions:

1) Do I need to update my current (2007) Florida product Approval # Fl. 3203-R2 to meet the new Florida Building Code 2010, ASCE 7-10 ? Yes or no
2) Do I need to meet the exposure ratings (B,C,D) of the Florida Building Code 2010 section 1609.4.3 Building section and ASCE 7-10 (FL). Where Florida Building Code 2007 ASCE 7-05 only applies Exposure “C”? Yes or no.

3) Is it correct that Florida Building Code 2010, ASCE 7-10 (FL) specifies higher lateral loads of 3.1 to 1 for all building heights. Where the Florida Building Code 2007, ASCE 7-05 only specified 1.9 to 1.0 for buildings 60° or less. Yes or no.

4) Is it correct that the Florida Building Code 2010, ASCE 7-10(FL) specifies the use of uplift pressure equal to 1.5 to 1 and the Florida building code 2007, ASCE 7-05 used no additional uplift pressure? Yes or no.

5) Do I need to meet both the higher lateral loads and uplift loads? Yes or no

6) I am correct to say the 2010 FBC - Residential Section R4403.9.1 Building and structures, and every portion thereof, shall be designed and constructed to meet the requirements of chapter 26 through 31 of ASCE 7-(10)? Yes or no.

7) Does the Governor want the FBC 2010, ASCE 7-10 (FL) to be applied to building doors, garage doors, windows and roof tiles? Yes or no

Why would you build a building to meet the new Florida Building Code 2010 ASCE 7-10(FL) and approve a weaker Florida Building Code 2007, ASCE 7-05 to roof stands and a/c tie down clips? I believe you are making the roof the weakest part of the building by applying the old Florida Building Code 2007, ASCE 7-05 to the stands and a/c tie down clips.

Request:

1) To clarify the HB 704, Section 16-4) Bill passed by the Governor. As I interpret it only applies to the mechanical equipment or appliances.

2) To clarify 2010 Florida Building Code, ASCE 7, Section 301.12 Wind Resistance of the Mechanical section of the Florida Code 301.12 Wind Resistance. Mechanical equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures on the equipment and the supports as determined in accordance with the Florida Building Code, Building. Roof-mounted mechanical units and supports shall be secured to the structure. The use of wood “sleepers” shall not be permitted. As I interpret it, covers mechanical equipment, appliances and supports that are exposed to the wind.

3) Myself and other Building Officials interpret the Governors Bill only applies to equipment and appliances. Not stands, platforms, curbs, slabs, etc.

Respectfully,

Raymond A. Manucy
President, RM Enterprises Inc.
For the utility升起的 vertical load shall be multiplied to be reduced linearly from 1.5 to 1.0 as the value of AR is increased from (0.18R) to (R).

Additionally, a simultaneous uplift force shall be applied, given by Equation 29.5-1 of ASCE 7, in which

\[ \text{AP} = (0.18 + 0.82R) \]

The lateral force on rooftop structures and equipment with AR less than (0.18R) located on buildings of

**2010 Florida Building Code - 1609.8 Roof Top Structures and Equipment**

---

*Per FBC 2010: GCF = As per FBC Section 1609.8.*

*Per ASCE 7-10: GCF = As per ASCE Figs. 29.5-1 through 29.5-3.*

\[ GCF = \text{Values depending on code used} \]

\[ z = 0.00256 K^2 K_{1T} K_{D} \]

*Where:

\[ f = z \times GCF \times A \]

Basic Force Equation:

ASCE 7-10 - Section 29.5 "Design Wind Loads - Other Structures"
\[ D_{pl} = 0.6W \]

\[ WH = 0.25G \times CF \]

6'10" OR MORE

No additional uplift

\[ D_{pl} = W \]

\[ WH = 0.25G \times CF \]

Wall not to smallest building depending on ratio of

\[ QZ = \text{base pressure} \]

\[ WV = QH \times CF \times (uplift) \]

\[ WH = 0.6W \]

6'10" OR LESS

All building heights
